

A Faster Response & A Safer Environment

TomTom BRIDGE: Working with Airbus Defence & Space – the global pioneer providing innovative space and defence solutions worldwide – to enable faster incident responses

Deployed into operational vehicles on a TomTom BRIDGE unit, SAFEcommand Guide (ScGuide) brings together mapping, data communications and status updates with in-built TomTom routing capabilities.

ScGuide displays the incident details for the mobilisation request and allows the operator to acknowledge receipt of the mobilisation message. The incident location is shown on TomTom BRIDGE mapping and navigation can begin immediately – avoiding potential errors in verbal transfer of information or manual data input, and saving time. When the status changes, ScGuide will remove the incident location display.

ScGuide supports status messaging between the operator and the C&C system. When utilised in an officer's car or small vehicle (not equipped with mobile data), it improves the response speed and increases the number of simultaneous actions possible by both the ScGuide user and the C&C operator by removing voice contact. It also ensures all messages are added to the incident message log in the C&C.

The solution

Integrated operational and routing system

- Access to full incident information.
- Uses TomTom BRIDGE in-built mapping.
- Automatically launches TomTom BRIDGE in-built routing.
- Intuitive touch-screen interface allows users to switch between maps and incident information with a single touch.

Real-time mobile data communications

- Offering mobilising and status messaging facilities.

Internationalised Design

- Supports global mapping and coordinate systems.
- International language support.

The results

- Simple and reliable data communications tools ensure efficient use of communications bearers, helping to reserve voice communication for when it is most needed.
- Can be used in conjunction with ScResponse without the need for dual entry of an incident location.
- The intuitive and easy-to-use touch screen interface is based on ScResponse.
- Priority message facilities are provided for emergency situations.
- Private APN is used for transmission of messages.

“The integrated ScGuide and TomTom BRIDGE solution brings greater efficiency, faster response and increased safety, helping us to keep voice channels clear for when they’re most needed.” ~ Airbus
