## **Maximising Fleet Efficiency** & Giving Drivers Greater Control

## TomTom BRIDGE: Delivering a flexible entry-level telematics solution with Nufatron

As a leading manufacturer of highly customised on-board computers and telematics systems for logistics in Switzerland, Nufatron was looking for a professional hardware base for its new entry-level telematics app. As Nufatron preferred to give its customers an integrated solution rather than a solo app. TomTom BRIDGE was chosen to seamlessly connect the telematics application with maps, traffic information, and navigation software. TomTom BRIDGE's Android™ OS offers the freedom to run and control further business apps from Nufatron that can take care of specific businessrelevant tasks in logistics and beyond - in addition to its telematics app, TRANSPO-Drive® 2015.

- An entry-level telematics solution is expandable by modules: basic messaging, locating (track & trace), imaging, advanced mobile order processing with POD, cost centre capture and more.
- Tachograph is integrated with vehicle and driver card data remote download.
- Toll on-board unit is integrated with toll data remote download.
- Can be used with proprietary fleet management platforms or external despatch systems.
- Additional business apps can be integrated for customer-specific requirements.

## The results

- Efficiency is increased by automating workflows.
- Paperbound processes are minimised.
- Operating costs are reduced.
- Time savings are made by receiving immediate responses.
- Individual performance records are available, with assignment to cost centres.

"Nufatron's telematics app on TomTom BRIDGE saves time and money in our everyday working life. The solution also offers an ideal platform to accommodate further business apps for our group-specific tasks in logistics and logistics-related services." ~ Alan Nicolier, Marti Gründungstechnik AG
